

Hudson Ag center purchases new equipment

The agronomy center at Hudson just took delivery of a 2010 John Deere combination spreader / sprayer. This unit improves our service by providing VRT spreading capabilities and the latest in technology. The new unit on the right is equipped with a New Leader twin bin spreader that can spread conventionally or according to a precision prescription. It is also equipped with auto steering to insure that coverage is maximized, neither overlapped nor skipped. The ag center calibrated and tested the unit last week and it is ready to go to work on your fields as soon as you are ready.

The liquid unit will go on in the spring and will look like a twin to the unit purchased two years ago (the unit on the left). It is also equipped with automatic boom shutoff and boom height control to provide you the latest in spraying accuracy for your fields.
