Slow Darkening Pinto Seed Planting Recommendations

To help establish an adequate plant population for SDP Vibrant* and SDP Radiant* seed, it is recommended to **plant during the following optimum soil and air temperatures on or after May 20th.**

- » Bare Soil Temperatures reach 58°F at a 4.0 inch depth.
- » High Air Temperatures forecast at 65°F or above for 6 consecutive days prior to planting.

Slow darkening pinto seed has been found to perform the best when planted into warmer soil and increasing air temperatures as stated above.

Temperature data compiled using 2015, 2016 and 2017 NDAWN site data. NDAWN is copyrighted by NDSU.

* Vibrant and Radiant are protected by US Plant Variety Protection and have US Utility Patents.
